

New Research Affirms Increase in Access, Equity of COVID-19 Vaccines Administered in Dialysis Centers

Results demonstrate the importance of vaccinating patients at trusted sites of care

DENVER and WALTHAM, Mass., April 4, 2022 /PRNewswire/ -- A federal partnership established to help increase access to COVID-19 vaccines for end stage kidney disease (ESKD) patients receiving dialysis was successful in reducing racial disparities in vaccination coverage, [new research published today](#) in *JAMA Internal Medicine* affirms. Compared to white patients, Hispanic, Black and Asian patients were more likely to receive at least one dose of COVID-19 vaccine in a dialysis center.

The Centers for Disease Control and Prevention (CDC) collaborated with [DaVita](#), [Fresenius Medical Care North America](#) and other partners in March 2021 to create the Federal Dialysis Provider COVID-19 Vaccine Partnership. Both providers received allocations of COVID-19 vaccines from the federal government to administer to patients in dialysis centers and distribute to other dialysis providers across the country.

"We were steadfast in our advocacy efforts to support patients with kidney failure by providing access to the vaccine through the pandemic. We're incredibly grateful for the collaboration between the CDC and the kidney care community to leverage our capacity, experience and footprint to bring dialysis patients direct access to COVID-19 vaccines," said Dr. Jeff Giullian, chief medical officer for DaVita and study co-author. "The results of this study affirm that providing vaccines at trusted sites of care is an effective approach to helping to reduce hesitancy and advance equity for patients of color who have been disproportionately affected by the COVID-19 pandemic."

"I appreciate all the members of our frontline care teams who worked so hard to efficiently vaccinate our vulnerable patient population," said Dr. Jeffrey Hymes, global head of clinical affairs for Fresenius Medical Care and another study co-author. "This important partnership with the CDC shows how well our dialysis centers can be used to reach often underserved populations and improve equitable access to care, especially for people at highest risk of complications from viruses like COVID-19."

The new study evaluated the impact of dialysis clinics serving as COVID-19 vaccine providers on vaccination coverage and disparities from Dec. 1, 2020, through June 13, 2021. Vaccination coverage was calculated using the number of patients at nearly 5,200 Fresenius and DaVita dialysis centers who received at least one dose of vaccine, regardless of location. Researchers found that:

- As of March 28, 2021, shortly after the federal partnership launched, vaccination coverage among white patients was 52%, exceeding coverage in Black (45.2%) and Hispanic (51.3%) patients. Asian patients had higher vaccination coverage (60%) than white patients.
- By June 13, 2021, vaccination coverage among Asian (74.1%) and Hispanic (69.5%) patients exceeded that of white patients (65.5%), with vaccination coverage among Black patients slightly lower (63%).
- Overall, 50.7% (312,046) of vaccinated patients were vaccinated in a dialysis clinic during the evaluation. Compared to white patients (42.5%), Hispanic (62.2%), Black (55.4%) and Asian (49.5%) patients were more likely to receive the COVID-19 vaccine in a dialysis center.

The researchers recommend that public health agencies and policymakers prioritize dialysis centers for federal vaccine allocations and on-site vaccine administration in the future.

More than [500,000 Americans](#) diagnosed with ESKD receive life-sustaining dialysis care. Due to underlying conditions that may compromise their immune systems, these patients are often at higher risk for COVID-19 infection. ESKD patients are also some of the [most racially and ethnically diverse](#) in health care.
