

Falcon Physician Launches Nephrology Charting App

DENVER, Aug. 31, 2016 /PRNewswire/ -- Falcon Physician recently launched [Falcon Charting](#), the newest application in a suite of nephrology-focused electronic health record (EHR) tools. The tool is available to all physicians who use the Falcon Platinum product.

Created as a desktop application, Falcon Charting was developed to offer significant speed and performance improvements over previous applications with a completely re-designed user interface. With guidance from over 50 practicing nephrologists, the application was developed for optimal workflow from the moment a patient walks in the door until the moment the patient leaves.

"We built it to allow for more collaboration between the patient and provider," said Justin Williams, Falcon Physician senior product manager. "We will continue to expand Falcon Charting's functionality to support physician workflow in order to improve care."

Falcon Charting is designed to support personalized workflows to help create efficiencies for nephrologists and an increased speed between application and integration with dialysis rounding functionality.

About Falcon Physician

The Falcon Physician product suite integrates with the dialysis center and doctor's office to help manage kidney patients' health records from CKD through ESRD and can be accessed wherever there is internet access. Developed in collaboration with practicing nephrologists, Falcon's technology tools are supported by a dedicated team of health technology experts.
